

Business Rules Summary from Mainframe Files

The analyzed mainframe files contain business logic for **payroll processing, customer management, and batch orchestration**.

Core Business Rules by Component

PAYROLL.cbl - Payroll Calculation Engine

- Processes employee salary information for payroll calculation
- **Tax tier logic:** Employees with salary > \$50,000 are assigned a higher tax amount
- Calculates net salary by subtracting tax from gross salary
- Reads and updates employee master payroll details in the database
- Creates audit records for compliance and tracking of all payroll processing

CUSTOMER.cbl - Customer Master Management

- Reads and updates customer master details
- Calls customer audit process for customer risk tracking
- Maintains customer data integrity through audit trail

EMPREC.cpy - Shared Data Structure

- Legacy copybook used as a shared data structure across mainframe batch processes
- Provides common employee record definitions

JOB001.jcl - Batch Orchestration

- Orchestrates mainframe batch processing workflow
- Coordinates execution of payroll, customer, sorting, and reporting programs

Business Rules Summary by File

File Name	Business Rules
CUSTOMER.cbl	Reads and updates customer m
EMPREC.cpy	Legacy asset used for mainfram
JOB001.jcl	Legacy asset used for mainfram
PAYROLL.cbl	Processes employee salary infor

Key Business Logic Highlights

The most critical business rule is the **progressive tax calculation** in PAYROLL.cbl, which applies different tax rates based on a \$50,000 salary threshold. Both PAYROLL and CUSTOMER programs implement **audit trail mechanisms** to ensure compliance and traceability of all data modifications.
